## MODULAR BORING SYSTEM

Pinzbohr boring system features a wide range of rough and finish boring heads covering diameters from 6 mm. up to 500 mm.

There are three types of boring heads:

- 1) Rough boring heads (two inserts) with synchronized adjustment.
- 2) Finish boring heads (one insert) with graduated precision dial read out.
- 3) Micro adjustable boring heads (for small diameters) fitting indexable boring bars with also graduated precision dial read out.

All these boring heads are radially adjustable to machine different diameters.

Different arbor designs are available mating the most popular spindles. Extensions and reducers compliment the modular system to offer a complete flexibility across the range.

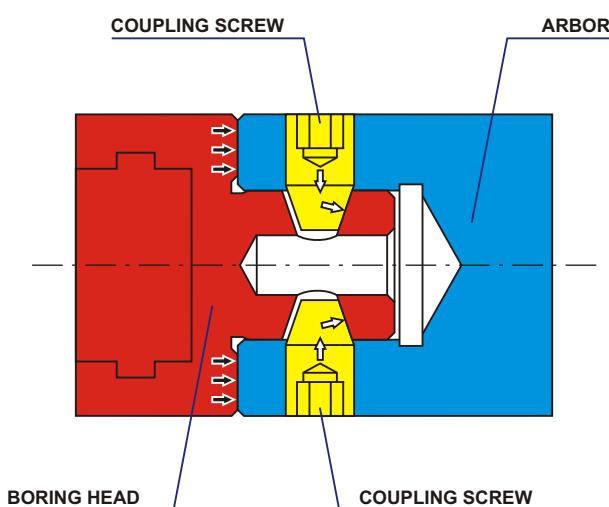

The system features a wide range of ISO standard insert pocket choices and indexable cartridges.

The taper screw design allows tools to be changed without removing from the spindle. Main components are manufactured from Nickel-Chrome alloy steel, heat treated to 58-60 HRC.

Precision ground slides ensure accuracy of adjustment throughout the heads working life.

## COUPLING SYSTEM

### HIGH RIGIDITY

By tightening the two coupling screws, high axial forces are developed in the tapered holes of the arbor. These axial forces preload the contact surface between the flange faces of the coupled components with high axial pressure for ample support against lateral loads. It can also dampen vibrations.

### POSITIVE TOOL ORIENTATION

The locating pin guarantees repeat positioning between components at all times.

**All arbors, extensions and reducers are shipped complete with coupling screws.**

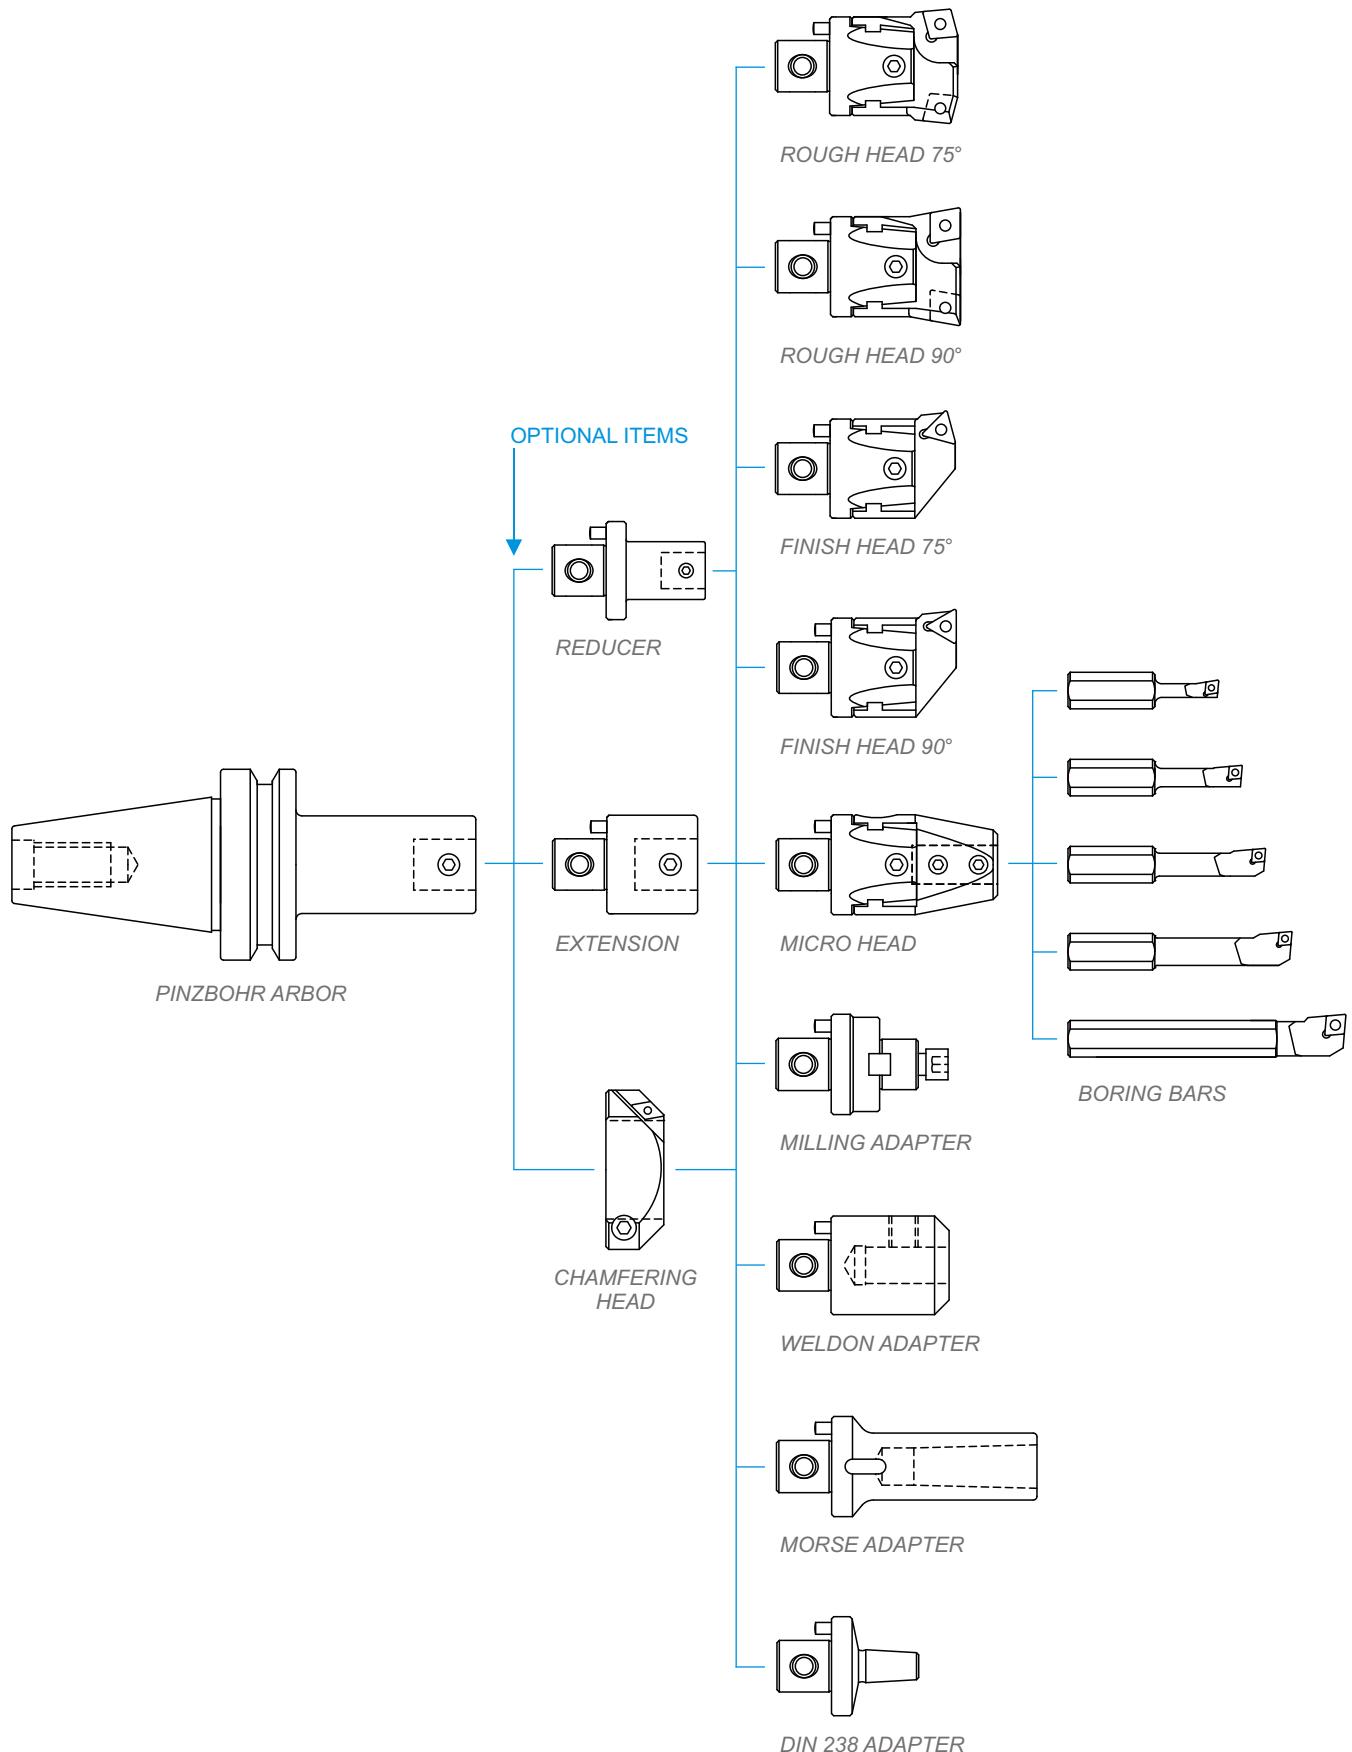

## ADVANTAGES

---

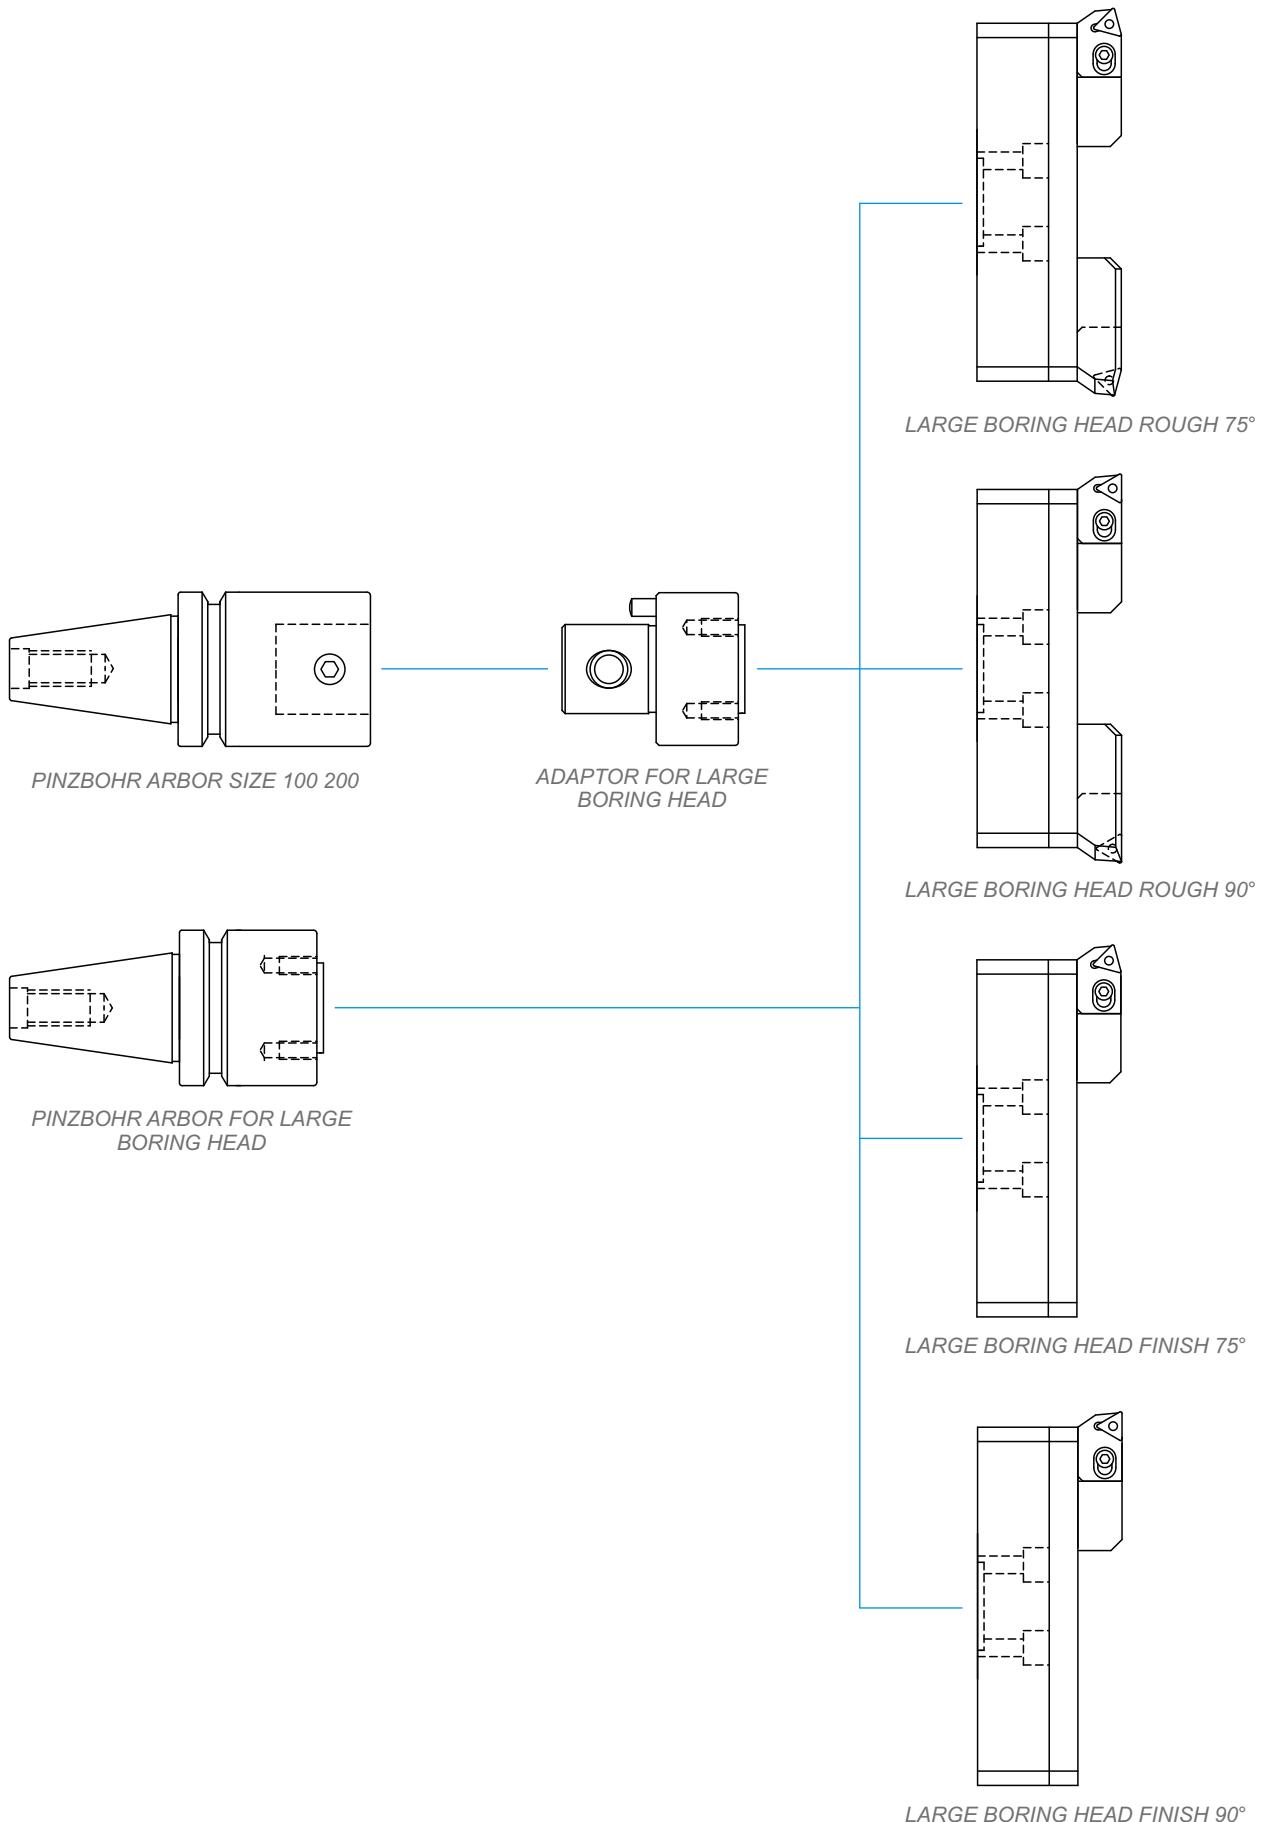

- Practical modular system: different types of boring heads with arbors, extensions, reducers allow price reduction when tooling up the machine.
- Wide range of diameters: 6 to 500 mm.
- High accuracy and rigidity: clamping with taper screws (coupling screws).
- Safety-set assembly: designed to prevent damaging the adjustment screw.
- Synchronized adjustment in rough boring heads (no need pre-setting slides with individual adjustment).
- Fine adjustment in finish boring heads: graduated dial and read out precision up to 0.002 mm. in diameter.
- Cutting tool selection among a wide variety of insert geometries.
- Main components Nickel-Chrome alloy steel heat treated to 58-60 HRC.
- Ground components to ensure accurate production.

# PRODUCT OVERVIEW

# PRODUCT OVERVIEW

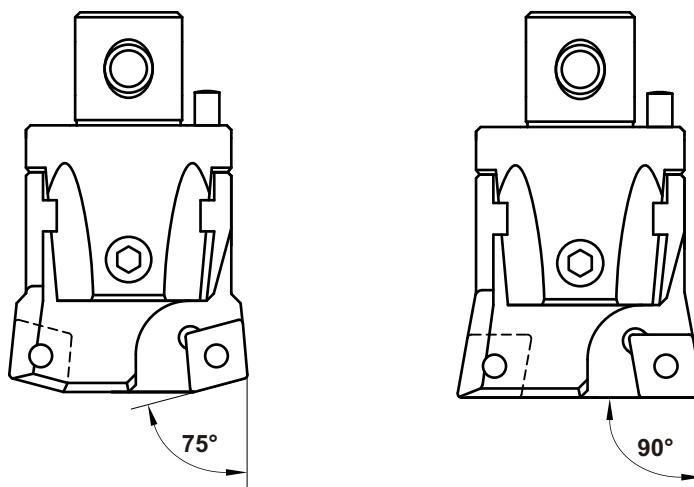

# MODULAR BORING SYSTEM DESCRIPTION

## ROUGH BORING HEADS

These boring heads with two cutting edges do have synchronized adjustment. This advantage means not to waste time in presetting the two cutting edges for a balanced cut (diameter adjustment can be set in the machine directly with a caliper).

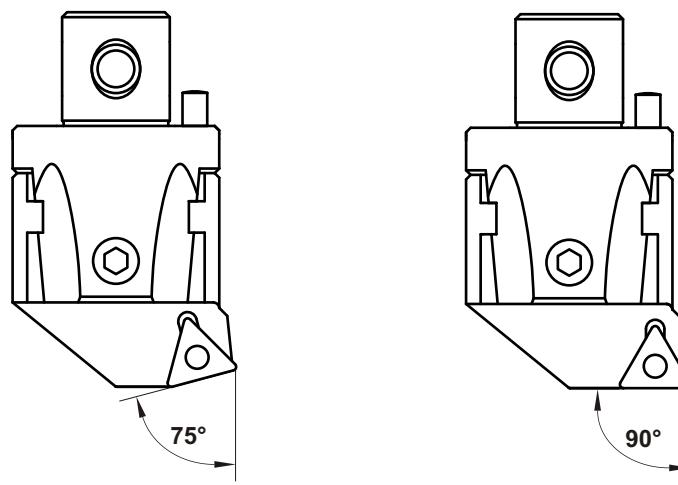

For diameters from 24 mm up to 220 mm, rough boring heads are available in two choices of angle approach: 75° & 90°. And feature various insert pocket geometries to choose.

## FINISH BORING HEADS

These adjustable boring heads do have a read out precision of 0.002 mm Ø.

For diameters from 24 mm up to 220 mm, finish boring heads are available in two choices of angle approach: 75° & 90°. And feature various insert pocket geometries to choose.

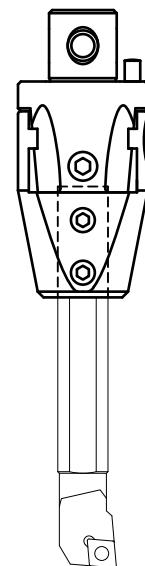

# MODULAR BORING SYSTEM DESCRIPTION

## MICRO BORING HEADS

MICRO boring heads are used in combination with indexable ISO boring bars; these units can produce bores down to 6 mm diameter and up to 38 mm diameter. MICRO boring heads fit the standard Pinzbohr arbors size 27, 32 and 42 (recommended in extra short execution).

Graduated dial and read out precision of 0.002 mm Ø.

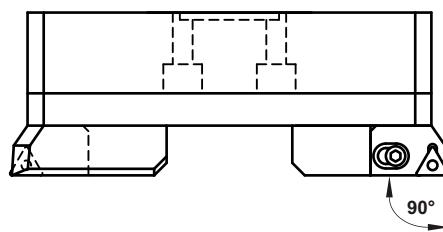

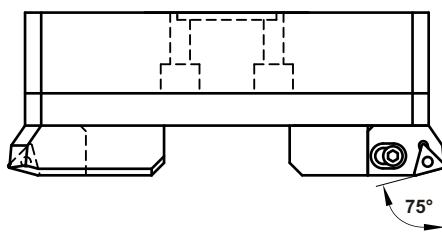

## LARGE DIAMETER BORING HEADS

These boring heads, either rough and finish do have graduated dial and read out precision of 0.002 mm Ø and a diameter range that goes from 220 mm up to 500 mm.

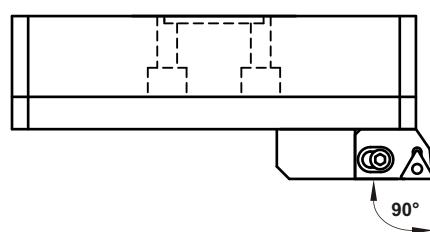

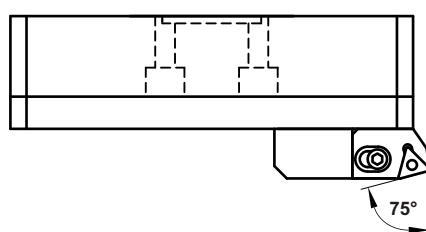

Four (4) facing coupling screws do the assembly of large diameter boring heads to its holder.

By using *ADT 100 050* adaptor it is possible to assemble large diameter boring heads to the standard size *100 200* Pinzbohr arbors to allow the use of longer arbors for deep boring applications.

# ASSEMBLY SYSTEM FOR LARGE BORING HEADS

## HOW TO FIT THE LARGE DIAMETER BORING HEAD ON THE TAPER

Remove the position screws (D 300 57) and push along the slides until the four coupling screw sockets appear. Put together the taper face with the four screw sockets over the head's back end, then fit and tighten the 4 coupling screws.

## MOUNTING THE SLIDES ON THE HEAD

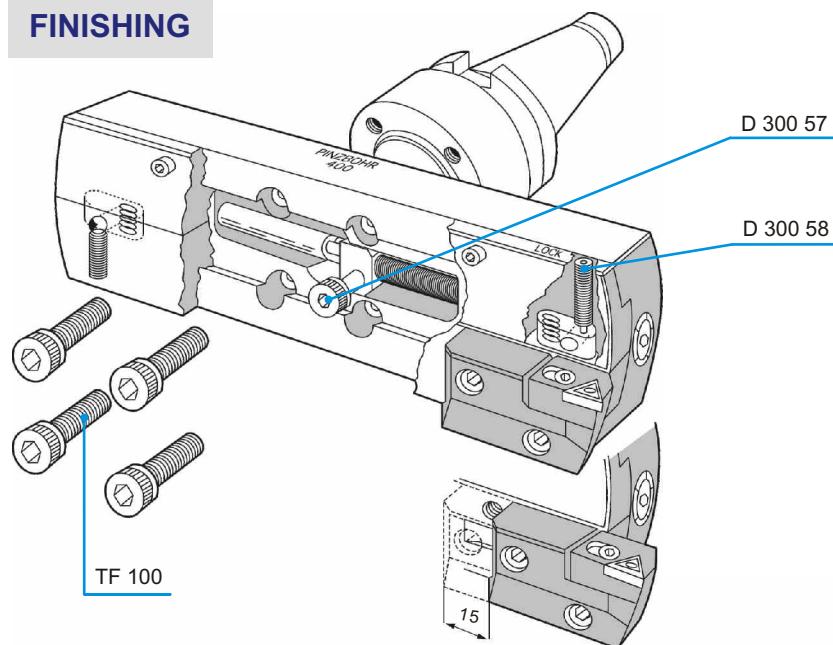

Insert both slides into the V guides, push them along until they face the nut thread holes. Fit the screws (D 300 57) and tighten them lightly.

The function of these screws is dual, fixing the slide into the V guides and linking both the slide with the bronze lead nut.

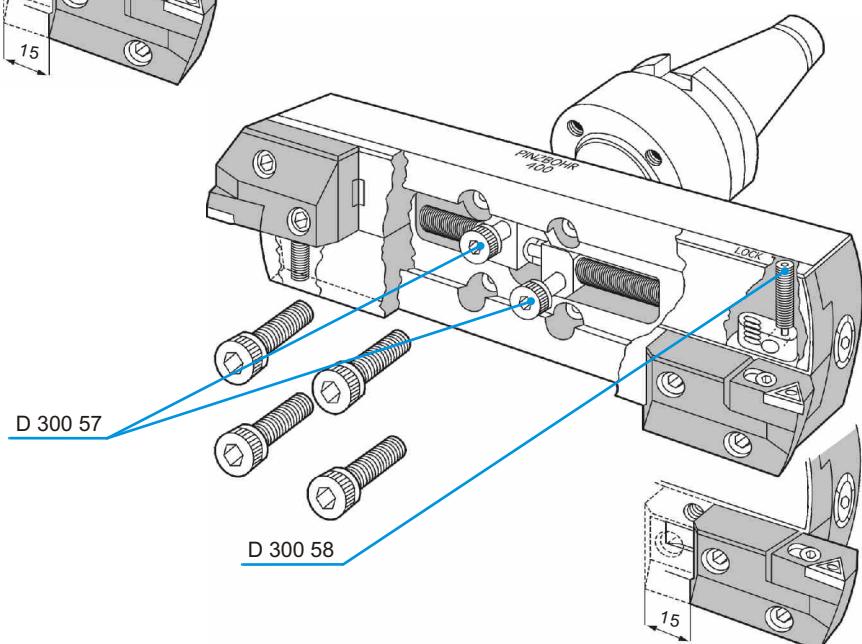

Finally check that the slide (slides in roughing) glide softly.

**Attention:** During the entire mounting process the brake screw (D 300 58) must be released.

## Features

- Several hole solutions with only one boring head.
- Rhombic or triangular kit insert choice.
- Bohrstar 54 boring head read out precision of 0.002 mm Ø.
- Bohrstar 54 boring head matches with all arbors and accessories size 54 shown on this main catalog.

# APPLICATION HINTS

---

---

## SPEEDS AND FEEDS

Ultimate or optimum speeds and feeds will depend upon material, machine and setup conditions, as well as tool overhang.

## BORING DEPTH - TOOL OVERHANG FOR ROUGHING AND FINISHING

Under conditions suited for carbide tooling depths of  $5x \varnothing$  for rough boring and  $3x \varnothing$  for finish boring are achievable. With the increasing overhang, the mechanical stability of the tool body decreases. Overlength tools will have a tendency for deflections as well as harmonic (high pitch) chatter. Harmonic chatter can cause movement of adjusting components inside the boring head leading to off-size or tapered holes.

In many cases the high pitch harmonic chatter can be damped by increasing the feed and (or) lowering the cutting speed.

Please note that the cutting behavior will also change with the amount of slide block (insert holder) extension from the boring head requiring adjustments regarding speeds and feeds.

## BORING DEPTH - TOOL OVERHANG FOR MICRO BORING HEADS

The maximum boring depth with steel boring bars should not exceed  $5x$  bar diameter and  $7x$  bar diameter with solid carbide bars. We recommend to shorten the bars to the shortest overhang necessary according to the required boring depth.

## ROUGH BORING HEAD 75° vs. 90°

The 75° rough boring head should be used whenever a lot of stock is being removed and no square shoulder is required inside of blind or stepped hole. The 75° lead has a tendency to self-center to the pre-existing hole and therefore cut very stable. If this pre-existing hole, is off-center, shifted or off-angle then it is recommended to use the 90° boring head since the 90° lead angle will have less tendency to follow the pre-existing hole.

## AMOUNT OF STOCK REMOVAL

The maximum stock removal for rough boring may have to be decreased on very tough materials, extended overhangs as well as for extended slide blocks.

## INSERT CORNER RADIUS

For heavy duty roughing applications the largest available corner radius should be selected unless otherwise specified. For finish boring with very little stock removal the smallest available corner radius is most advantageous to minimize lateral tool deflection. This can be especially important on applications involving long overhangs.

## 4 CUTTING EDGES PER INSERT

The 80° diamond shaped insert provides normally for two cutting edges. However, all four cutting edges can be used if a 75° and a 90° rough boring head within the same size range is utilized. The same is possible between a 75° rough boring head and a 90° finish boring head.

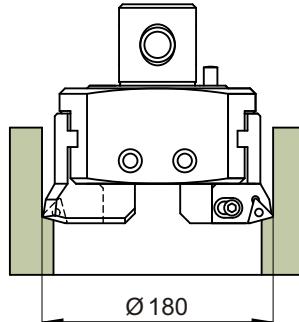

# EXAMPLES OF MACHINING

## ROUGH BORING

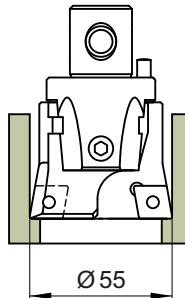

### THROUGH HOLE

Material: 42 Cr Mo 4  
 Boring head: D 20075 300  
 Arbor: BT 350 100 260
